Election of Species Requirement

This application contains claims directed to more than one species of the generic invention. These species are deemed to lack unity of invention because they are not so linked as to form a single general inventive concept under PCT Rule 13.1.

The species are as follows:

Bioactive glasses containing P, F and O, and the metals:

- 1) Na
- 2) K
- 3) Li and/or
- 4) Al.

Applicant is required, in reply to this action, to elect a single species of bioactive glass, containing a single species of metal (or a specified mixture of metals) to which the claims shall be restricted if no generic claim is finally held to be allowable. The reply must also identify the claims readable on the elected species, including any claims subsequently added. An argument that a claim is allowable or that all claims are generic is considered non-responsive unless accompanied by an election. Claims 1, 18, 24, 51 and 52 are generic.

Upon the allowance of a generic claim, applicant will be entitled to consideration of claims to additional species which are written in dependent form or otherwise include all the limitations of an allowed generic claim as provided by 37 CFR 1.141. If claims

Art Unit: 1614

are added after the election, applicant must indicate which are readable upon the elected species. MPEP § 809.02(a).

The species listed above not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding technical feature. See, *e.g.*, USP 5,762,950 at col. 1, lines 17-25, which teaches that bioactive glasses must contain sodium (as Na₂O), but not necessarily K, Li and/or Al. Accordingly, bioactive glasses containing each different metal do not necessarily share a common technical feature.

Furthermore, Applicant is requested to specify the individual oxides used to produce the instant glasses, i.e. to elect a specific base bioactive glass composition containing P, F and O. This is necessary since bioactive glasses are in fact the sintered products of particular oxides, and not simply amalgams of the elements P, F and O as currently recited. Without knowing the starting oxides, a meaningful search of the prior art is impossible. Note, for example, that USP 5,762,950 uses a ternary mixture of the particular oxides SiO₂, Na₂O and CaO, sintered to glass. (Col. 1, lines 17 and 18).
